

ABSTRACT OF THE DISCLOSURE

A memory card is set into a slot of a printer. The printer distinguishes whether or not frames of the memory card are recorded in a grouping format. When the frames
5 are recorded in the grouping format, a main-index picture merely including representative frames of the grouped frames is displayed. Selection of the representative frame changes the picture to a sub-index picture for displaying an index of the frames included in the group
10 concerned. In comparison with a case in that all the frames are displayed on the sole index picture, classification of the frames is easily grasped. Further, the frames may be confirmed every group so that it is easy to search the frame.
